Human SPARC, C-His Tag Protein HA210516

Product name: Human SPARC, C-His Tag

Species reactivity: Human

Bio-Activity: Testing in progress.

Protein construction

description:

A DNA sequence encoding the human SPARC protein (P09486) (Ala 18-Ile 303) was expressed with a His at

the C-terminus.

Background: This gene encodes a cysteine-rich acidic matrix-associated protein. The encoded protein is required for the

collagen in bone to become calcified but is also involved in extracellular matrix synthesis and promotion of changes to cell shape. The gene product has been associated with tumor suppression but has also been correlated with metastasis based on changes to cell shape which can promote tumor cell invasion. Three transcript variants encoding different isoforms have been found for this gene. Appears to regulate cell growth through interactions with the extracellular matrix and cytokines. Binds calcium and copper, several types of collagen, albumin, thrombospondin, PDGF and cell membranes. There are two calcium binding sites; an acidic domain that binds 5 to 8 Ca(2+) with a low affinity and an EF-hand loop that binds a Ca(2+) ion with a high

affinity.

Purity: >95% as determined by SDS-PAGE.

Endotoxin: Less than 1.0 EU per µg by the LAL method.

Fragment region: SPARC (18-303)

Source: HEK293

Accession: P09486

Predicted molecular mass: 34.1 kD

Formulation: Lyophilized from a 0.2 µm filtered solution of PBS, pH7.4, 5% Trehalose, 5% mannitol.

Reconstitution: Reconstitute at 250 µg/ml in sterile water.

Storage: Please avoid repeated freeze-thaw cycles. Samples are stable for up to twelve months from date of receipt at -

 20° C to -80 $^{\circ}$ C It is recommended that aliquot the reconstituted solution to minimize freeze-thaw cycles.
