Description: Major role in the synthesis of nucleoside triphosphates other than ATP. The ATP gamma phosphate is transferred to the NDP beta phosphate via a ping-pong mechanism, using a phosphorylated active-site intermediate. Possesses nucleoside-diphosphate kinase, serine/threonine-specific protein kinase, geranyl and farnesyl pyrophosphate kinase, histidine protein kinase and 3'-5' exonuclease activities. Involved in cell proliferation, differentiation and development, signal transduction, G protein-coupled receptor endocytosis, and gene expression. Required for neural development including neural patterning and cell fate determination. During GZMA-mediated cell death, works in concert with TREX1. NME1 nicks one strand of DNA and TREX1 removes bases from the free 3' end to enhance DNA damage and prevent DNA end reannealing and rapid repair.

Immunogen: Synthetic peptide within Human NM23 aa 1-50 / 152.

Positive control: HEK-293 cell lysate, MCF7 cell lysate, Jurkat cell lysate, HeLa cell lysate, HepG2 cell lysate, K-562 cell lysate, A549 cell lysate, Raji cell lysate, NIH/3T3 cell lysate, C6 cell lysate, mouse kidney tissue lysate, mouse liver tissue lysate, mouse brain tissue lysate, rat brain tissue lysate, rat liver tissue lysate, human liver carcinoma tissue, human thyroid tissue, human skin tissue, human breast carcinoma tissue, 293.
