**Description:** CD3 (cluster of differentiation 3) is a protein complex and T cell co-receptor that is involved in activating both the cytotoxic T cell (CD8+ naive T cells) and T helper cells (CD4+ naive T cells). It is composed of four distinct chains. In mammals, the complex contains a CD3 $\gamma$  chain, a CD3 $\delta$  chain, and two CD3 $\epsilon$  chains. These chains associate with the T-cell receptor (TCR) and the CD3-zeta ( $\zeta$ -chain) to generate an activation signal in T lymphocytes. The TCR, CD3-zeta, and the other CD3 molecules together constitute the TCR complex.

**Fig1:** Flow cytometric analysis of mouse spleen labeling Mouse CD3.

Cells were washed twice with cold PBS and resuspend. Then stained with the primary antibody (HA720201F, 1µg/mL) (red). Unlabelled sample was used as a control (cells without incubation with primary antibody; black).
