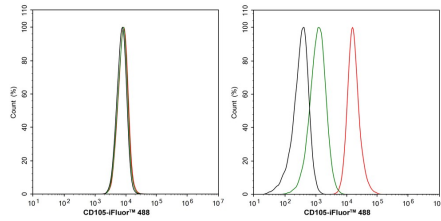

Fig1: Flow cytometric analysis of LNCaP (left, negative) and U-937 (right, positive) cells labeling CD105.

Cells were washed twice with cold PBS and resuspend. Then stained with the primary antibody (HA751587, 1/1,000) (red) compared with Rabbit IgG Isotype Control (green). After incubation of the primary antibody at +4°C for an hour, the cells were stained with a iFluor™ 488 conjugate-Goat anti-Rabbit IgG Secondary antibody (HA1121) at 1/1,000 dilution for 30 minutes at +4°C. Unlabelled sample was used as a control (cells without incubation with primary antibody; black).
